

AutoDraw

AutoDraw is a tool that uses artificial intelligence to guess what you're trying to draw. You start with a blank screen, begin sketching something, and AutoDraw gives you a strip of professionally illustrated images to choose from, based on *what the tool thinks you're trying to draw*.

Every time you add more detail to your own sketch, AutoDraw's guesses change. When you see an image that matches what you're going for, you can choose it, then add color, resize it, or basically manipulate it however you want. If you choose to, you can turn OFF the automatic feature and just sketch without any assistance, but seriously, that feature is a thing to behold.

When your masterpiece is complete, you can automatically download it as a PNG file, share it on Twitter or Facebook, or grab a unique URL and share it that way.

Just go to www.autodraw.com and start drawing. It's that easy!

Here is a short video on how to use it: <https://youtu.be/VwRbvVrUXTc>
